

## Protect your family and your home

Due to climate change and harsher ultraviolet rays, there is a strong need to protect your home from the harmful effects of exposure to UV. Ultraviolet light is a major factor in degradation of materials stored in the home. Curtain lining has been specially designed to block out the maximum amount of UV rays and protect your curtain fabric, furniture, carpets and skin.

All Filigree's coated linings rate 50+, the highest rating possible as tested by the Australian and New Zealand UPF regulatory authority, ARPANSA.

## Save on heating and cooling

Windows are prone to condensation, chill, and heat loss during winter. Just a single degree drop in your home adds 10% to your heating bill. The inverse is true in summer, as glass exacerbates the effect of the sun's heat. Energy-loss savings of up to 40% can be achieved with heavy curtains, pelmets and curtain linings.

If you do not have adequate insulation and drapery, your heating and cooling energy is going to waste.

## Help achieve a 6-star energy rating and cut greenhouse emissions

An adequately lined curtain effectively reduces your heating and cooling costs and your home's carbon footprint, making it easier than ever to achieve an optimal 6-star energy rating.

## Reduce noise & light

Curtain linings turn day into night, offering room darkening, privacy and protection. Ideal for shift workers, babies or home theatres, ambient light noise can be reduced by using curtains backed with quality lining. Noise absorption creates a peaceful environment for babies, children, adults, and pets.
